Animal Tissue-Clearing Reagents

Advantages

- Basic protocol

Clearing of whole mouse bodies as well as animal organs can be achieved by using two reagents in sequence: **CUBIC-L** [T3740] for delipidation and either **CUBIC-R+(N)** [T3983] or **CUBIC-R+(M)** [T3741] for RI matching.

The difference between **CUBIC-R+(N)** [T3983] and **CUBIC-R+(M)** [T3741]:

CUBIC-R+(N) is inexpensive and easier to handle because it raises less precipitation.

The fluorescence signal may decay, but the fluorescence signals of samples in **CUBIC-R+(N)** can be observed for several days after immersion. **CUBIC-R+(M)** is superior in retaining the fluorescence signal. However, at low temperatures such as in winter, it may precipitate. In that case, it can be resolved by placing the sample at 37°C for a few days.

For these reasons, it is recommended to try **CUBIC-R+(N)** first and then use **CUBIC-R+(M)** if fluorescence signal cannot be found.

Thiol Quantification Kit

- Enables highly sensitive detection of thiol groups.
- Using Ellman's reagent instead of antibodies allows for measurement irrespective of species-of-origin.
- Two vials of both Ellman's reagent and thiol standard are included to allow for a total of two reactions from one kit.
- The reaction products are soluble and have an absorption maximum wavelength at 412 nm.
- Enables accurate quantification of thiol groups in a concentration range of 10 - 1000 µM.

Photo-reactive Crosslinkers

Phenyldiazirines

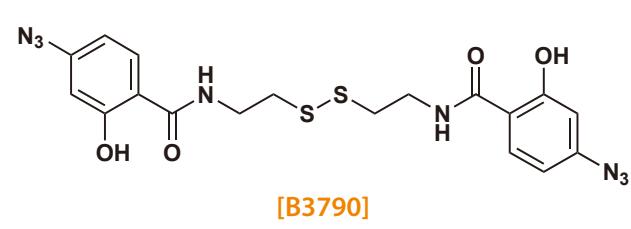

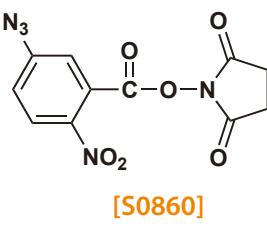

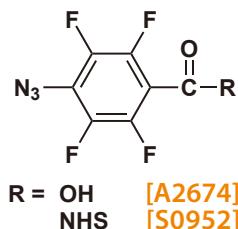

$R = CH_2OH$	[T2818]
CH_2Br	[T2819]
$COOH$	[T2820]
$CH_2NH_2 \cdot HCl$	[T3448]

Phenyldiazirine generates a carbene unit by UV irradiation (<360 nm). Phenylcarbene can crosslink by short-time irradiation due to higher reactivity than nitrenes. Phenylcarbene is inactivated by water when neighboring target molecules are absent, and thus does not lead to non-specific crosslinking.

4-[3-(Trifluoromethyl)-3<i>H</i>-diazirin-3-yl]benzyl Alcohol	200mg / 1g [T2818]
4-[3-(Trifluoromethyl)-3<i>H</i>-diazirin-3-yl]benzyl Bromide	200mg / 1g [T2819]
4-[3-(Trifluoromethyl)-3<i>H</i>-diazirin-3-yl]benzoic Acid	200mg / 1g [T2820]
4-[3-(Trifluoromethyl)-3<i>H</i>-diazirin-3-yl]benzylamine Hydrochloride	200mg / 1g [T3448]

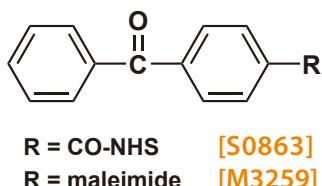

Phenylazides

Phenylazide generates a nitrene by UV irradiation (<300 nm). It is noted that azido groups tend to have less harmful effect on target analyte. Activation of the nitrene requires a shorter wavelength of UV light, and potential protein denaturation during long-period irradiation should be taken into consideration.

4-Azido-2,3,5,6-tetrafluorobenzoic Acid <i>N</i>-Succinimidyl Ester	200mg / 1g [S0952]
5-Azido-2-nitrobenzoic Acid <i>N</i>-Succinimidyl Ester	10mg [S0860]
Bis[2-(4-azidosalicylamido)ethyl] Disulfide	10mg [B3790]

Benzophenones

Benzophenone excited by UV irradiation (near 360 nm) to induce hydrogen abstraction from target molecules. The reaction efficiency remains high despite this due to the reversibility of the excited state. Additionally, photoexcited benzophenone is not water-reactive.

4-Benzoylbenzoic Acid <i>N</i>-Succinimidyl Ester	200mg / 1g [S0863]
4-(<i>N</i>-Maleimido)benzophenone	50mg / 250mg [M3259]

Copper-free Click Reaction Reagents

Cell Proliferation / Viability Assay Reagents

For Cell Counting via Chemiluminescence Measurement

Advantages

- These pre-mixed reagents allow for quick and easy use - just thaw on ice and apply to cells, no need to remove medium. Results in only 10 minutes.
- High-sensitivity, linear ($R^2 > 0.99$) quantification of cell numbers over four orders of magnitude (20 - 10,000 cells per well of 96-well plate).
- Color change (from red to orange) upon addition to culture medium helps prevent confusion when dealing with large numbers of samples.

Cell Proliferation / Viability Assay Reagents

For Cell Counting via Absorbance Measurement

MTT is a type of tetrazolium salt that is converted into formazan when taken up by living cells. This formazan can be dissolved in DMSO and the absorbance at 540 nm can be used to estimate the relative number of cells.

For Cell Counting via Fluorescence Measurement

Resazurin can be used to determine relative cell number, useful in the quantification of such phenomena as cell proliferation, viability, and cytotoxicity. When added to viable cells, blue, non-fluorescent resazurin undergoes a conversion to a highly fluorescent derivative. Both resazurin and its derivative are water soluble and have low toxicity, making it simple to handle and eliminating the washing, fixing, and extraction steps required for other commonly used cell proliferation assays.

RNA Base-modified Nucleoside Triphosphates

In recent years, numerous studies have demonstrated that mRNA has outstanding abilities to elicit potent immune responses, making it a viable new platform for the development of next-generation vaccines. This product is the 5'-triphosphate sodium salt of 1-methylpseudouridine ($m^1\psi$) which enables comparatively high protein yields and is read as uridine (U). Furthermore, $m^1\psi$ enhances immune evasion and consequently improves vaccine efficacy.

Epigenetics Research Reagents

It has been revealed that cells memorize information and regulate gene expression regardless of the gene sequences at the stages of growth and differentiation. The research about DNA methylation and Histone modification related to the epigenetic mechanism is expected to be applied to cancer treatment or regenerative treatment.
